

HOW TO PROVIDE A GOOD MUD MAP OF YOUR TARGET AREA

The above is a good example because.....

- North is clearly shown (and it is at the top of the map!)
- Power lines are shown in red with pole locations
- Road names are shown
- A waypoint (Lat/Long) is shown
- Houses (and who lives in them) are clearly identified
- Dams, creeks, tree plots and windmills are clearly shown
- Target areas (shaded) are clearly designated
- Target areas are labelled with crop type and area.
- Adjacent susceptible crops are clearly marked.

Good quality maps assist us in accurately identifying your crop target area and any susceptible crops, houses or watercourses nearby. Good maps also provide our operations managers and pilots with crucial safety information such as location of roads, powerlines, windmills and trees.
